

Phishing simulation code explained -

```
<form onsubmit = "return fakeLogin()">
```

```
<script>
```

```
function fakeLogin() {
```

```
document.getElementById("message").style
```

```
display = "block";
```

```
return false;
```

```
</script>
```

★ return false - stops the form from actually submitting anywhere

★ document.getElementById("message") - finds the paragraph with id = "message" (the gotcha text)

★ .style.display = "block" - makes hidden paragraph visible

display : none = makes it invisible until the button is clicked.

style - changing the CSS within javascript

block - block level box

changing the property from none to block.
